MAPS NEWS ABOUT HELP

INTERACTIVE MAPPING AT YOUR FINGERTIPS

Get Started

WHAT IS MAGIC?

The MAGIC website provides authoritative geographic information about the natural environment from across government. The information covers rural, urban, coastal and marine environments across Great Britain. It is presented in an interactive map which can be explored using various mapping tools that are included. Natural England manages the service under the direction of a Steering Group who represent the MAGIC partnership organisations.

LATEST NEWS

The next update to datasets and the interactive map will be carried out on Wednesday 13th October 2021. The interactive map will be unavailable from 4pm until approximately 7pm on this day to allow the update to take place. More on Data updates can be found [here](#)

[Close Window](#)

GB1900 Quarries and Collieries

This demonstration viewer displays names relating to Quarries and Collieries from the final [GB1900 dataset](#).

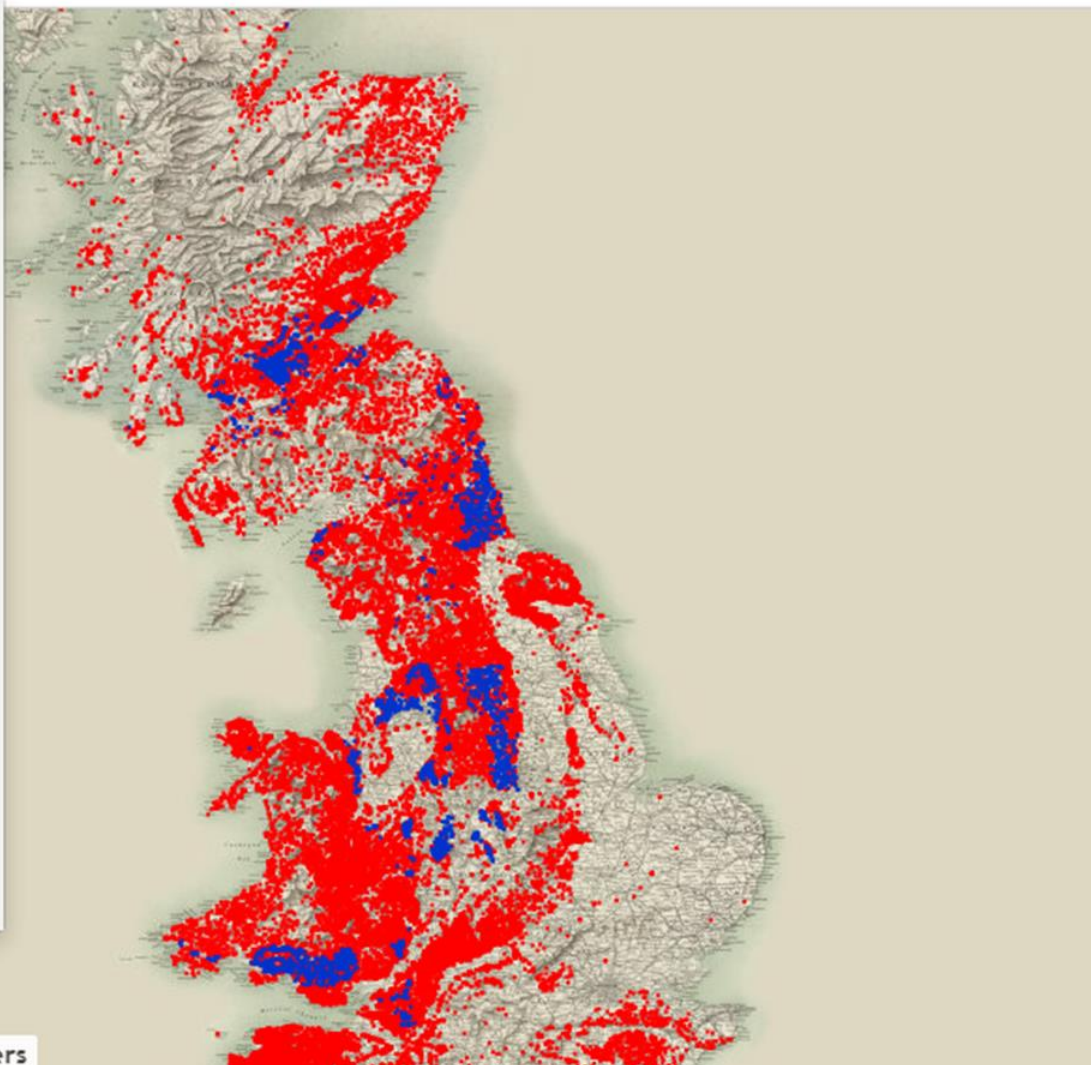

This includes 44,142 names with "Quarry" or "quarry", and 3,042 names with "Colliery" or "Colly.". Although not all of these names relate to real world quarries or collieries, as they also include some names with these words within them, it is estimated that well over 95% of the point features shown relate to former or active quarries or collieries at the time these maps were produced, ca. 1888-1913.

If you keep zooming in beyond zoom level 14, the points should appear against a background OS six-inch to the mile map, as visible in GB1900, with the quarry or colliery named.

It is also possible to toggle the background layer to display a 1950s geological map.

Todmorden

1953 Smallpox outbreak

Todmorden

afternoon, Thursday
12th March 1953

Dr Lyons, the Medical Officer for Todmorden picks up the phone. A consultant at the Halifax General Infirmary tells him that they have just diagnosed a patient with variola major smallpox, the deadliest kind. It carries a fatality rate of 30%.

There had been no smallpox locally for 15 years and no deaths since 1893. As a result vaccination rates are less than 50%. There is no time to wait for lab tests, lives are at risk. Dr Lyon orders a large supply of vaccine and sends out an urgent bulletin for doctors, to look out for smallpox and also report adult chickenpox too.

<https://www.timepix.uk/>

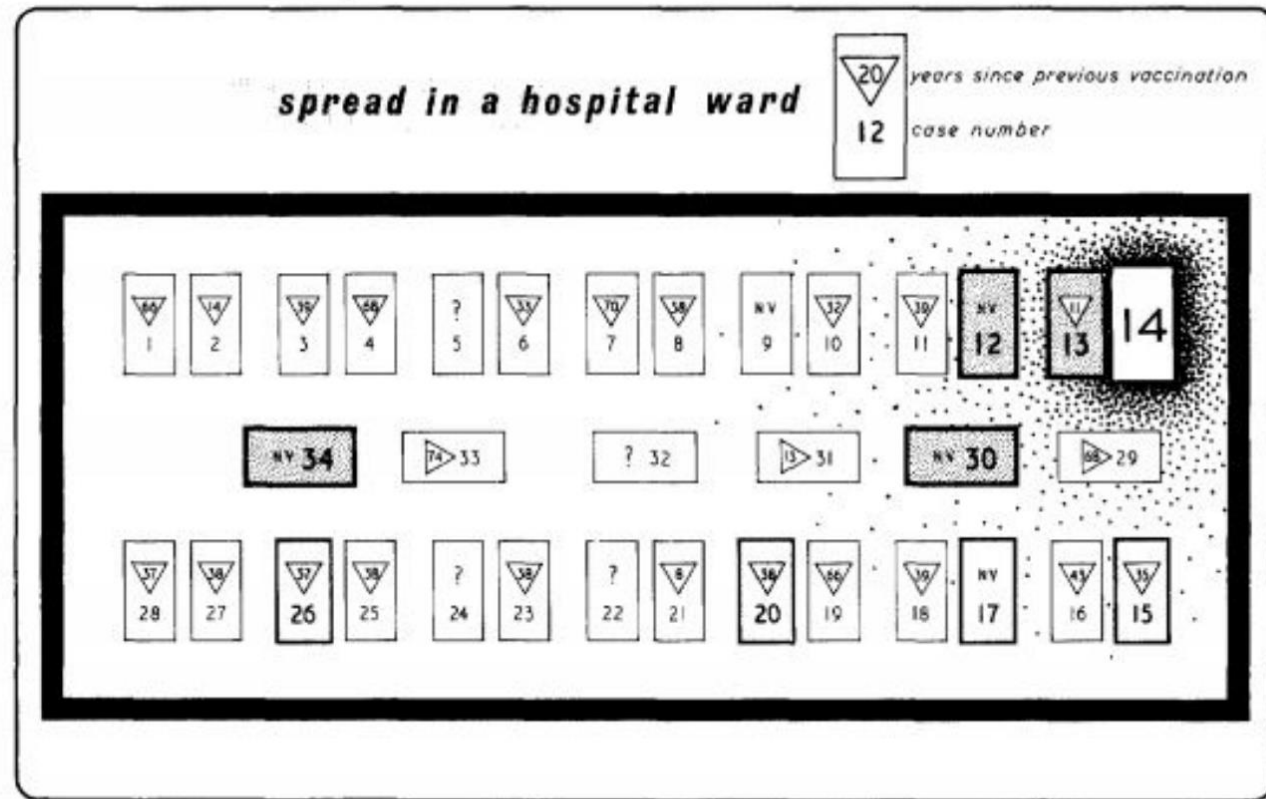

On 2nd March, Mr Jones* had a cold, but went to work at the mill as normal. On the 5th he started a fever so stayed in bed. By the 7th 'red pimples' erupted and he started vomiting.

His doctor had once worked in a smallpox hospital, but the idea of finding the disease in Todmorden in the 1950s was so preposterous that he dismissed the thought. Instead he called a dermatologist and between them they made a tentative diagnosis of severe generalised herpes simplex. Mr Jones was sent by ambulance to the Halifax General Hospital.

One glance and the dermatologist changed his mind. Smallpox was the only possible diagnosis no matter how improbable. Mr Jones was rapidly removed to the barely-used Ainsworth smallpox hospital.

The hospital ward was isolated patients told they had to remain for 16 days. All used bedding and other items from the ward were daily sent down the fire escape to be burnt. Games, books and even a piano were introduced to entertain them. The hospital was closed for 3 weeks and all staff, patients and visitors who were in the hospital that day were vaccinated.

14: smallpox patient admitted as generalised herpes simplex. All patients vaccinated after contact. 12, 13, 30, 34 contracted smallpox. 15, 17, 20, 26 had pyrexial attacks within 14 days of contact.

Raw cotton, a key suspect

The next case found was Mr Thorpe a young man who worked 14 miles away at a cotton mill in Oldham. Despite vaccination both his mother Mrs Thorpe and Miss Bryson his girlfriend fell ill. All recovered.

No link could be found between Mr Thorpe and Todmorden, but it was discovered that both mills (and only those mills) had used raw cotton from the same consignment. The suspect cotton bales were quickly traced, isolated and destroyed.

Local doctors were on high alert and four days later, 16-year-old Sam from Linthwaite near Huddersfield was quickly diagnosed. He was a lorry drivers mate often travelling in the Leeds area. Sam was sent to the Oakwell Smallpox Hospital, Birstall with four members of his family. Three more contacts were found to have raised temperatures and soon followed. Luckily none developed smallpox and Sam himself recovered well.

Mr Giles who worked at a clay pit supervising the loading of lorries near Gildersome, not far from Leeds, was less fortunate. Drivers often came into the works cabin and he developed a very severe attack that he was lucky to survive.

Why was smallpox not found in a lorry driver? A unique set of circumstances applied to them. They were almost all ex-servicemen whose wartime vaccinations meant that a smallpox infection for them was so mild that they might just have a slight fever and a bad headache, things that might have any number of causes. But a small number of them must have been infectious, and those youngsters or civilians the drivers infected generally became much more ill.

Mons Mill: the epicentre

Dr Lyons ordered that everyone who had been in close proximity with Mr Jones must be identified. 'Even people who just walked past him without stopping'.

Mill and family contacts were vaccinated, told to stay off work and to keep to themselves for 16 days. People who had not been closer than 10 feet were vaccinated, but allowed to carry on working. Both groups had to report daily for a skin inspection.

It wasn't long before some began to show symptoms, including his wife and daughter and three visitors to his house. Again, the prompt vaccinations reduced their smallpox attacks to mild cases (although this was still an unpleasant flu-like illness for them to suffer). Having infected 9 other people Mr Jones also survived.

The mill was cleaned and reopened, but there was alarm that the more distant contacts were being allowed back to work. Where did Mr Jones catch it? That's what people wanted to know because other workers, indeed anyone, might be at risk.

The local newspapers were reporting daily on the story. The town council wanted to close public places and a travelling fair was turned away. More

Missed cases and tragic outcomes

Investigators soon found mill employees who had been misdiagnosed. Mr Brown had died on 13th March, 24 hours after being admitted to hospital with 'scarlet fever'. His wife and two children were immediately sent to the smallpox hospital. *(photo shows hospital screened by trees north of Knowsley Road)* The youngsters were lucky to have only a mild attack, but their mother was severely ill. Mr Brown's last journey to work had been by bus, but the risk was low so that fact was kept secret to prevent more panic in the town. No cases arose in any fellow passengers.

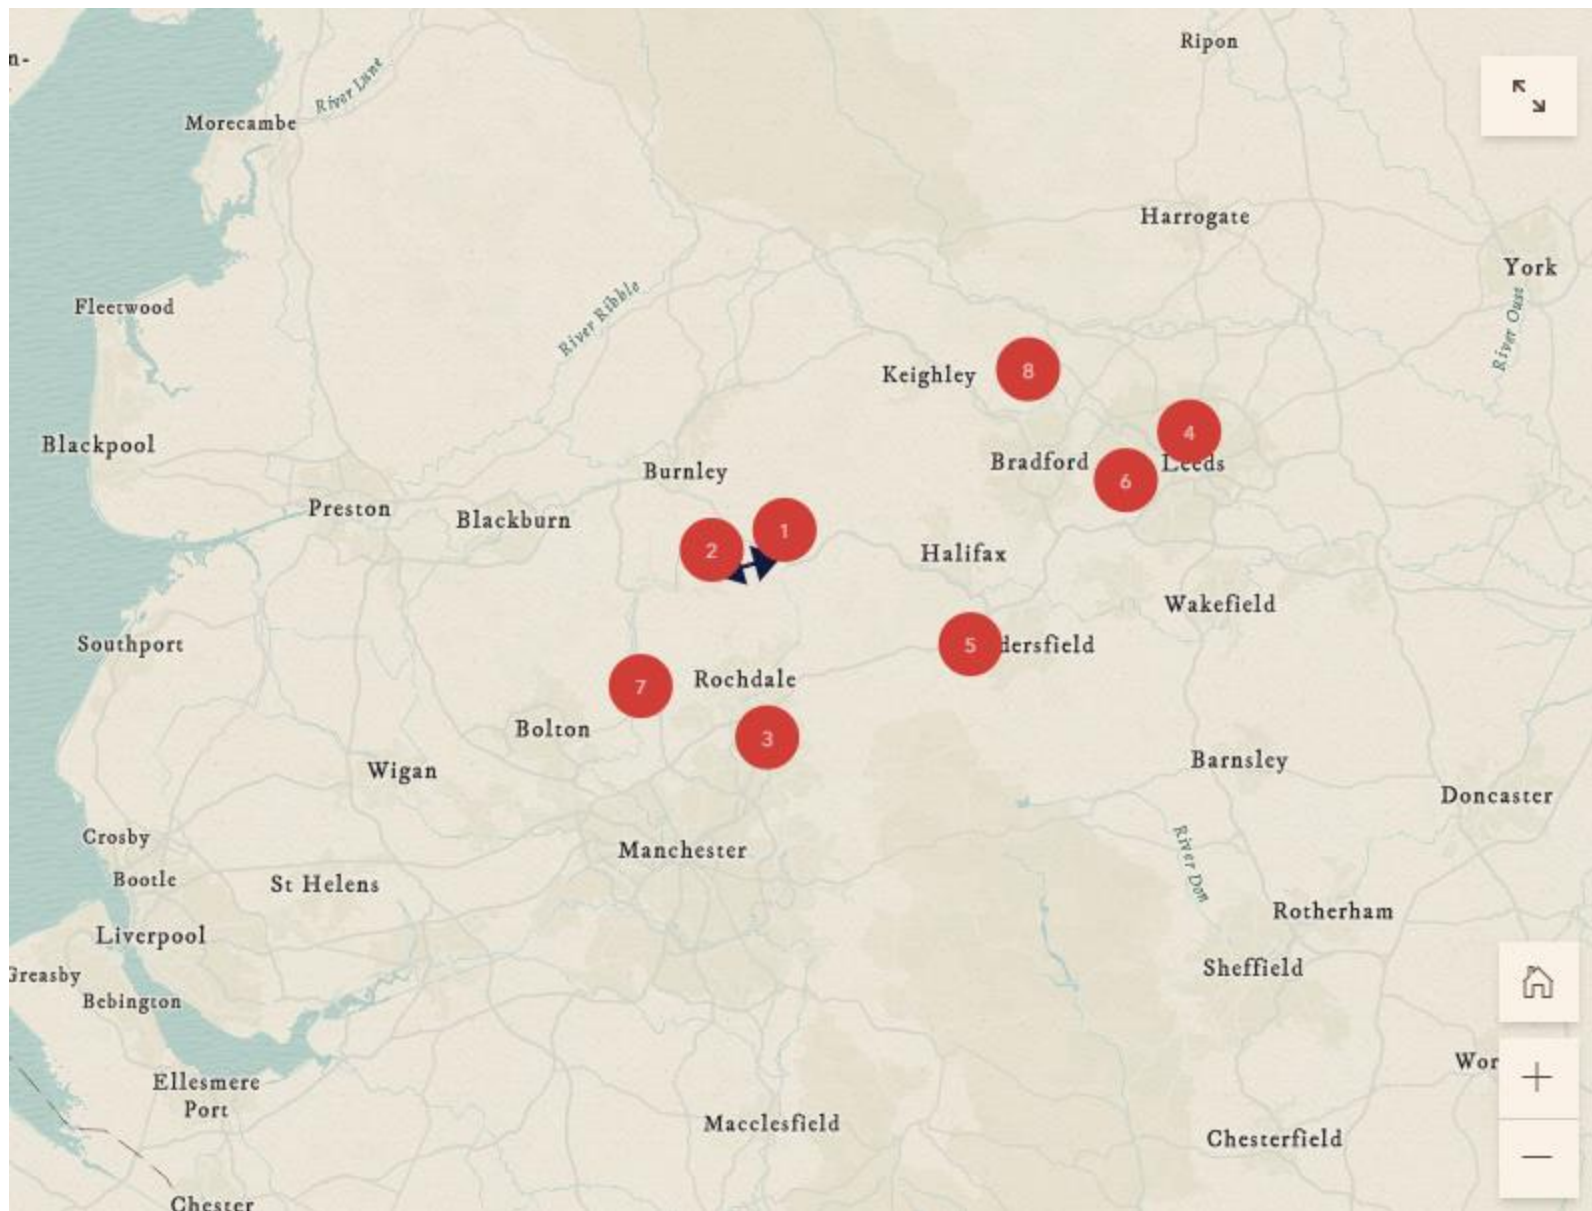

They also found Mr North, age 60, had been off sick with chickenpox since the 28th February. By 15th March he was feeling better and was thinking of returning to work, but instead found himself and his entire household removed to the smallpox hospital. His wife was already sick, initially dismissed by Mr North as "She's often like this".

All were vaccinated, but it was too late. Within 24 hours his wife was dead, followed after a few days by his eldest son aged 19. Another son aged 14 survived. A middle-aged lodger, Mrs Smith also died. Only her son, a 19-year-old youth, on leave from the RAF, was unaffected. He had been vaccinated two months earlier.
